## Notes :

(1) "EIAJ-ED-1501/(old)ET-145 Testing methods for continuous wave magnetron" by Electronic Industries Association of Japan, is referred.
(2) Breaking of filament should not be observed.
(3) Maximum rating for short time operation is given as follows.

1. $330{ }^{\circ} \mathrm{C}$------ Allowable at an operating for within 15 minutes (cumulated operating time should be within 50 hours)
2. $380{ }^{\circ} \mathrm{C}$------ Allowable at an operating for within 15 minutes (one time only)
(4) Classification of tests is given as follows.

| Mark | Class |
| :---: | :--- |
| None | Production test |
| $*$ | Design test |
| $* *$ | Type approval test |

Marks are at the left of each test item. (ex. *Surge voltage)

## Notes (continued) :

(5) These limits are defined as convered values to $25{ }^{\circ} \mathrm{C}$

Conversion should be done using the equation shown below.
$\operatorname{ebm}(T)=\{1-0.002(\mathrm{~T}-25)\} \mathrm{ebm}$
Po $(T)=\{1-0.002(\mathrm{~T}-25)\}$ Po
(Where, ebm(T), $\operatorname{Po}(\mathrm{T})$ : Values at ambient temperature $T\left({ }^{\circ} \mathrm{C}\right)$ )
(6) pulling figure is the difference between the maximum and the minimum frequency of oscillation that occurs when the phase of the reflection coefficient of the load is varied over the $\lambda \mathrm{g} / 2$.
The sink phase is defined as the phase to give maximum change of the frequency and to give the same oscillating frequency as that at matched load.
In both cases, with the variation of phase, the load VSWR should be held at the stated value ( $\sigma \mathrm{L}=4$ )
(7) Measured with Narda type 8110 radiation monitor.
(8) Measured with the microwave oven accepted by both parties.
(9) Mechanical strength (A)
: The antenna cover should not be drawn out when it is pulled to the direction of antenna axis with stated force.
Mechanical strength (B)
: Any degradation of breakdown voltage should not be observed after pressing the filter box with standard test finger with stated force.
Mechanical strength (C)
: The terminals should withstand stated pulling force to the direction of terminal axis.
(10) Any instability such as moding if run-away should not be observed at any load phase.
(11) Filament terminal with in-phase mark ("F") should be connected to the filament transformer so as to have the same polarity as anode.
(12) Test conditions are as follows.

Amplitude : 2 mm (peak to peak)
Frequency : 25 Hz
Time of vibration : 10 minutes (for each of three directions)
(13) Distance from reference place of magnetron (antenna axis) to mismatched point should be 27.6 inches $(700 \mathrm{~mm}) \mathrm{min}$.
(14) Should not discharge continuously.
(15) Load match may vary to higher VSWR in application, but must be reviewed by LG with regard magnitude, phase and dwell time.
(16) Microwave Oven : LG Standard Model

Method of measurement : open field.
Load condition : volume of water : 250 ml in 500 ml beaker position of load : center
(17) Maximum 57 dBpW at $80 \%$ of production.

## Notes (continued) :

(18) The filament current at high frequency operation shall be defined by effective value.

The test equipments to measure it are explained in note (21).
(19) The filament current at any conditions shall be in this specification.

It is not to include the rushed filament current during warm-up (approx. 5 seconds) The oven shall be cold state before the test starts.
(20) Test conditions :
(1) Microwave oven : The oven shall be accepted by both parties.
(2) Load: 1 litre water in in 1 liter beaker.
(3) Input voltage : Rated value
(4) Microwave power setting : Full power
(21) Test equipments :
(1) Current probe : TEKTRONIX A6303 or equivalent.
(2) Probe amplifier : TEKTRONIX AM503 or equivalent.
(3) Current meter: HEWLETT PACKARD 3404C or equivalent.
(22) The filament current shall be in this specification when it is measured at 60 seconds after the oven operations.
The oven shall be cold state before the test starts.

## MOUNTING ON LAUNCHER

DIMENSIONS IN MILLIMETERS

NOTE : 1 . This figure is without gasket.
2. Recommended structure of launcher

NOTE :

1. Flatness of embossed edge should be better than 0.1 mm to avoid microwave leakage.
2. Recommended pressure on gasket is 20 to 40 kg .
